Title: How to remove a property from an object?

Answer:

In order to remove a property from an object, you will utilize the `delete` keyword. `delete` is an operator that removes a property from an object.

In the below example, we will remove the `city` property from `person` using `delete`.

```
// Remove city from person
delete person.city;
```

```
Output
true
```

The `delete` operation evaluates as `true` if the property was successfully removed, or if it was used on a property that doesn't exist.

We can test the output of `person` to see if it succeeded.

```
person;
```

```
Output
{name: "Ramesh", profession: "full stack developer", age: 22, greet: ƒ, deta
ils: ƒ}
```

In the above output, the city name and its associated value are no longer available, showing that we have successfully deleted the property.
